

Ace Sections Ltd was established in 2003. The Directors having more years in the cold rolled sections industry than they care to admit to ! The business moved to its current address during 2006 to allow space for further rolling lines and other equipment.

Current equipment is four rolling lines. Two of these are used for general cold rolled sections and the company holds and maintains many sets of roll tools on behalf of our customers.

The other two rolling lines produce sections for the construction industry. These can be rolled to any transportable length. This is of particular importance in the fire protection trades where the use of un-spliced studs are important. In addition to rolling operations we can punch and drill holes to standard and customers specification.

Our work in the fire barrier field goes back twenty years when the directors were involved in the introduction of ready made components for fire wall assembly. We have developed this and now hold stocks of all the major components. These include head / base tracks and noggins all ready assembled with cleats. Studs can also be supplied bolted back to back when required.

In addition to the above products we can fabricate heavy duty steel frameworks from hot rolled products such as parallel flange channels and universal beams and columns.

Our rolling operations are further supported by our 3.0 metre shear and press brake. This gives us the flexibility to produce special and small quantity components from stock sheets very quickly.

So from bespoke sections to customer specification to our wide range of fire barrier steel work Ace Sections Ltd is chosen by many companies to support their operations both in the UK and overseas.
